***Abstract*—Replace this paragraph with the abstract of your paper. The abstract should state the problem, the proposed method, and the main results in 150–250 words. This template uses the IEEEtran conference class and compiles with pdfLaTeX.**

***Index Terms*—keyword one, keyword two, keyword three, LaTeX, IEEEtran**

I. Introduction

This is the introduction. Explain the background, the limitations of existing work, and summarize your contributions as an itemized list:

- **Contribution one:** a brief statement of the first contribution.
- **Contribution two:** a brief statement of the second contribution.
- **Contribution three:** extensive experiments on benchmark datasets.

II. Related Work

Summarize the most related approaches and clarify how your work differs from them. Cite references with `\cite`, e.g., deep models [1].

III. Method

Describe your overall framework here. An example equation:

$$\mathcal{L}(\boldsymbol{\theta}) = \frac{1}{N}\sum_{i=1}^{N} \ell\big(f(\boldsymbol{x}_i;\boldsymbol{\theta}),\, y_i\big) + \lambda \left\|\boldsymbol{\theta}\right\|_2^2 \tag{1}$$

where $\ell(\cdot)$ is the loss function, λ balances the regularization term, and N is the number of training samples. Reference the equation as (1).

IV. Experiments

A. Datasets and Metrics

Briefly describe the datasets and evaluation metrics.

B. Main Results

Table I reports the comparison with baselines.

V. Conclusion

Restate the problem and your approach, highlight the key findings, and outline future work.

TABLE I
Comparison with baseline methods on the benchmark.

Method	Acc.(%)	F1 (%)	Params (M)
Baseline A	85.2	84.1	21.3
Baseline B	87.6	86.9	34.8
Ours	**90.4**	**89.7**	28.5
